

# Parallel Lines Cut by a Transversal

Geometry Worksheet · Grade 8–10

Name: \_\_\_\_\_

Date: \_\_\_\_\_

## Learning Objectives

- Identify and apply the Alternate Interior Angles Theorem and its converse
- Identify and apply the Corresponding Angles Theorem and its converse
- Use supplementary angle relationships (linear pairs) and vertical angles to find missing angle measures

## Problems

1. Two parallel lines are cut by a transversal. Angle 3 measures  $70^\circ$ . Using the Alternate Interior Angles Theorem, what is the measure of Angle 6?

$$\angle 3 = 70^\circ, \quad \angle 6 = ?$$

2. Two parallel lines are cut by a transversal. Angle 5 measures  $112^\circ$ . What is the measure of its vertical angle, Angle 7?

$$\angle 5 = 112^\circ, \quad \angle 7 = ?$$

3. Two parallel lines are cut by a transversal forming a linear pair at one intersection. If one angle measures  $55^\circ$ , what is the measure of its supplementary angle?

$$180^\circ - 55^\circ = ?$$

4. Two parallel lines are cut by a transversal. Angle 1 and Angle 5 are corresponding angles, and Angle 1 measures  $83^\circ$ . What is the measure of Angle 5?

$$\angle 1 = 83^\circ, \quad \angle 5 = ?$$

5. Two parallel lines are cut by a transversal. Given that Angle 4 =  $125^\circ$ , find the measures of Angles 3, 5, and 6 using the properties of vertical angles, alternate interior angles, and linear pairs.

$$\angle 4 = 125^\circ$$

6. In the figure of two parallel lines cut by a transversal, Angle 3 and Angle 5 are alternate interior angles. If  $\angle 3 = (3x + 10)^\circ$  and  $\angle 5 = (5x - 20)^\circ$ , find the value of  $x$ .

$$3x + 10 = 5x - 20$$

7. Two parallel lines are cut by a transversal. Corresponding angles are represented as  $\angle 1 = (4x + 15)^\circ$  and  $\angle 5 = (6x - 5)^\circ$ . Find the value of  $x$  and the measure of each angle.

$$4x + 15 = 6x - 5$$

8. Two parallel lines are cut by a transversal. Angle 4 and Angle 6 are alternate interior angles. If  $\angle 4 = (7x - 3)^\circ$  and  $\angle 6 = (4x + 18)^\circ$ , find  $x$  and determine the measure of  $\angle 4$ .

$$7x - 3 = 4x + 18$$

9. Two parallel lines are cut by a transversal. A student claims that  $\angle 2 = 130^\circ$  and  $\angle 6 = 50^\circ$  are corresponding angles and therefore congruent. Is the student correct? Explain using the Corresponding Angles Theorem.

$$\angle 2 = 130^\circ, \quad \angle 6 = 50^\circ$$

10. Two parallel lines are cut by a transversal. Given  $\angle 1 = (2x^2 - x)^\circ$  and  $\angle 5 = (x^2 + 30)^\circ$  as corresponding angles, find all possible values of  $x$  and the measure of each angle.

$$2x^2 - x = x^2 + 30$$

# Parallel Lines Cut by a Transversal — Answer Key

Geometry Worksheet · Grade 8–10

## Answer Key

---

### 1. Answer: $70^\circ$

- Angles 3 and 6 are alternate interior angles (they lie between the parallel lines on opposite sides of the transversal).
- By the Alternate Interior Angles Theorem, alternate interior angles are congruent, so  $\angle 6 = 70^\circ$ .

### 2. Answer: $112^\circ$

- Angles 5 and 7 are vertical angles formed at the same intersection point.
- Vertical angles are always congruent, so  $\angle 7 = 112^\circ$ .

### 3. Answer: $125^\circ$

- A linear pair of angles is supplementary, meaning they add up to  $180^\circ$ .
- Subtract:  $180^\circ - 55^\circ = 125^\circ$ .

### 4. Answer: $83^\circ$

- Corresponding angles are in the same position at each intersection when a transversal crosses parallel lines.
- By the Corresponding Angles Theorem, corresponding angles are congruent, so  $\angle 5 = 83^\circ$ .

### 5. Answer: $\angle 3 = 55^\circ$ , $\angle 5 = 125^\circ$ , $\angle 6 = 55^\circ$

- $\angle 3$  and  $\angle 4$  form a linear pair:  $\angle 3 = 180^\circ - 125^\circ = 55^\circ$ .
- $\angle 5$  and  $\angle 4$  are alternate interior angles... wait —  $\angle 4$  and  $\angle 6$  are alternate interior angles, so  $\angle 6 = 125^\circ$ ?  
Re-check: using standard numbering,  $\angle 3$  and  $\angle 5$  are alternate interior angles so  $\angle 5 = \angle 3 = 55^\circ$ ;  $\angle 6$  and  $\angle 4$  are alternate interior angles so  $\angle 6 = 125^\circ$ ... Using the video's convention:  $\angle 5 = \angle 4$  (vertical) =  $125^\circ$ ;  $\angle 3 = 180^\circ - 125^\circ = 55^\circ$ ;  $\angle 6 = \angle 3$  (alternate interior) =  $55^\circ$ .

### 6. Answer: $x = 15$

- Alternate interior angles are congruent, so set the expressions equal:  $3x + 10 = 5x - 20$ .
- Solve:  $10 + 20 = 5x - 3x \rightarrow 30 = 2x \rightarrow x = 15$ .

### 7. Answer: $x = 10$ ; each angle = $55^\circ$

- Corresponding angles are congruent:  $4x + 15 = 6x - 5 \rightarrow 20 = 2x \rightarrow x = 10$ .
- Substitute:  $4(10) + 15 = 40 + 15 = 55^\circ$ .

### 8. Answer: $x = 7$ ; $\angle 4 = 46^\circ$

- Set alternate interior angles equal:  $7x - 3 = 4x + 18 \rightarrow 3x = 21 \rightarrow x = 7$ .
- Substitute:  $\angle 4 = 7(7) - 3 = 49 - 3 = 46^\circ$ .

### 9. Answer: No; corresponding angles must be congruent (equal), but $130^\circ \neq 50^\circ$ .

Math is hard. So we made it human.

- The Corresponding Angles Theorem states that if two parallel lines are cut by a transversal, then corresponding angles are congruent.
- Since  $130^\circ \neq 50^\circ$ , these angles cannot be corresponding angles on parallel lines — the student is incorrect.

---

**10. Answer:  $x = 6$  ( $\angle = 66^\circ$ ) or  $x = -5$  ( $\angle = 55^\circ$ )**

- Set corresponding angles equal:  $2x^2 - x = x^2 + 30 \rightarrow x^2 - x - 30 = 0 \rightarrow (x - 6)(x + 5) = 0$ , so  $x = 6$  or  $x = -5$ .
  - For  $x = 6$ :  $\angle = 2(36) - 6 = 66^\circ$ . For  $x = -5$ :  $\angle = 2(25) - (-5) = 55^\circ$ . Both are valid since angles are positive.
