

Trigonometry: Word Problems with Right Triangles

Practice Worksheet • numberbender.com

Name: _____ Date: _____ Score: / 10

DIRECTIONS

Draw and label a right triangle for each problem, then use SOHCAHTOA to solve. Show all work.

1

Identify the correct trig ratio:

$\theta = 40^\circ$, adjacent = 10, hypotenuse = x

Answer: _____

3

Solve for x (hypotenuse):

$$\cos 32^\circ = \frac{15}{x}$$

Answer: _____

5

Solve for the adjacent side:

$\theta = 60^\circ$, hypotenuse = 30, find adjacent

Answer: _____

7

Word problem — find the ladder length:

Answer: _____

9

Word problem — find the angle of depression:

Answer: _____

2

Identify the correct trig ratio:

$\theta = 55^\circ$, opposite = 7, hypotenuse = x

Answer: _____

4

Solve for the missing side:

$\theta = 45^\circ$, hypotenuse = 20, find opposite

Answer: _____

6

Find the missing angle θ :

$$\tan \theta = \frac{8}{6}$$

Answer: _____

8

Word problem — find the building height:

Answer: _____

10

Multi-step: find perimeter of triangle:

Answer: _____

Math is hard. So we made it human.

Answer Key & Solutions

Trigonometry: Word Problems with Right Triangles • Numberbender

N

TEACHER NOTE

Remind students to identify the reference angle first, then label the sides as opposite, adjacent, and hypotenuse relative to that angle. Emphasize selecting the correct trig ratio (SOH, CAH, or TOA) based on which two sides are known or needed. Calculators should be set to degree mode throughout this worksheet.

1 Identify the correct trig ratio:
 $\theta = 40^\circ$, adjacent = 10, hypotenuse = x

$$= \cos 40^\circ = \frac{10}{x}$$

Since we know the adjacent side and the hypotenuse, we use CAH: $\cos \theta = \text{adjacent/hypotenuse}$. The correct equation is $\cos 40^\circ = 10/x$.

2 Solve for x (hypotenuse):

$$\cos 32^\circ = \frac{15}{x}$$

$$= x = \frac{15}{\cos 32^\circ} \approx 17.68$$

Cross-multiply to isolate x : $x = 15 / \cos 32^\circ$. Using a calculator, $\cos 32^\circ \approx 0.848$, so $x \approx 17.68$ units.

5 Solve for the adjacent side:
 $\theta = 60^\circ$, hypotenuse = 30, find adjacent

$$= x = 30 \cdot \cos 60^\circ = 15$$

Use CAH: $\cos 60^\circ = \text{adjacent}/30$, so adjacent = $30 \cdot \cos 60^\circ = 30 \cdot 0.5 = 15$ units.

7 Word problem — find the ladder length:

$$= x = \frac{5}{\cos 70^\circ} \approx 14.62 \text{ ft}$$

The base (5 ft) is adjacent to the 70° angle and the ladder is the hypotenuse. Using CAH: $\cos 70^\circ = 5/x$, so $x = 5/\cos 70^\circ \approx 14.62$ ft.

9 Word problem — find the angle of depression:

$$= \theta = \tan^{-1}\left(\frac{80}{120}\right) \approx 33.69^\circ$$

The opposite side is 80 m (height) and adjacent is 120 m (distance). Use TOA: $\theta = \tan^{-1}(80/120) \approx 33.69^\circ$.

2 Identify the correct trig ratio:
 $\theta = 55^\circ$, opposite = 7, hypotenuse = x

$$= \sin 55^\circ = \frac{7}{x}$$

Since we have the opposite side and hypotenuse, we use SOH: $\sin \theta = \text{opposite/hypotenuse}$. The equation is $\sin 55^\circ = 7/x$.

4 Solve for the missing side:
 $\theta = 45^\circ$, hypotenuse = 20, find opposite

$$= x = 20 \cdot \sin 45^\circ \approx 14.14$$

Use SOH: $\sin 45^\circ = \text{opposite}/20$, so opposite = $20 \cdot \sin 45^\circ \approx 20 \cdot 0.707 \approx 14.14$ units.

6 Find the missing angle θ :

$$\tan \theta = \frac{8}{6}$$

$$= \theta = \tan^{-1}\left(\frac{8}{6}\right) \approx 53.13^\circ$$

Use the inverse tangent: $\theta = \tan^{-1}(8/6) = \tan^{-1}(1.333)$. A calculator gives $\theta \approx 53.13^\circ$.

8 Word problem — find the building height:

$$= h = 40 \cdot \tan 38^\circ \approx 31.25 \text{ ft}$$

The 40 ft distance is adjacent and the height is opposite. Use TOA: $\tan 38^\circ = h/40$, so $h = 40 \cdot \tan 38^\circ \approx 31.25$ ft.

10 Multi-step: find perimeter of triangle:

$$= \text{adj} \approx 22.07, \text{opp} \approx 11.74, P \approx 58.81$$

Adjacent = $25 \cdot \cos 28^\circ \approx 22.07$; Opposite = $25 \cdot \sin 28^\circ \approx 11.74$. Perimeter = $25 + 22.07 + 11.74 \approx 58.81$ units.
