

Simplifying Radical Expressions

Algebra Worksheet · Grade 8–10

Name: _____

Date: _____

Learning Objectives

- Simplify square roots by factoring out perfect squares
- Simplify cube roots by factoring out perfect cubes, including negative radicands
- Add, subtract, and multiply radical expressions by combining like radicals

Problems

1. Simplify the square root below:

$$\sqrt{36}$$

2. Simplify the square root below:

$$\sqrt{50}$$

3. Simplify the square root below:

$$\sqrt{72}$$

4. Simplify the cube root below:

$$\sqrt[3]{-54}$$

5. Simplify the cube root below:

$$\sqrt[3]{128}$$

6. Add the radical expressions below:

Math is hard. So we made it human.

More free sheets

$$-5\sqrt{3} - 3\sqrt{3}$$

7. Simplify and then add the radical expressions below:

$$\sqrt{45} + \sqrt{20}$$

8. Multiply the radical expressions below and simplify:

$$\sqrt{6} \times \sqrt{2}$$

9. Simplify the cube root expression below:

$$\sqrt[3]{27m^3n^5}$$

10. Simplify and then subtract the radical expressions below:

$$3\sqrt{98} - 2\sqrt{50} + \sqrt{8}$$

Simplifying Radical Expressions — Answer Key

Algebra Worksheet · Grade 8–10

Answer Key

1. Answer: 6

- 36 is a perfect square because $6 \times 6 = 36$
- So $\sqrt{36} = 6$

2. Answer: $5\sqrt{2}$

- Factor 50 into a perfect square factor: $50 = 25 \times 2$
- $\sqrt{50} = \sqrt{25 \times 2} = 5\sqrt{2}$

3. Answer: $6\sqrt{2}$

- Factor 72 into a perfect square factor: $72 = 36 \times 2$
- $\sqrt{72} = \sqrt{36 \times 2} = 6\sqrt{2}$

4. Answer: $-3\sqrt[3]{2}$

- Factor 54 into a perfect cube factor: $54 = 27 \times 2$
- $\sqrt[3]{-54} = \sqrt[3]{-27 \times 2} = -3\sqrt[3]{2}$

5. Answer: $4\sqrt[3]{2}$

- Factor 128 into a perfect cube factor: $128 = 64 \times 2$
- $\sqrt[3]{128} = \sqrt[3]{64 \times 2} = 4\sqrt[3]{2}$

6. Answer: $-8\sqrt{3}$

- Both terms have the same radical $\sqrt{3}$, so combine the coefficients
- $-5 - 3 = -8$, giving $-8\sqrt{3}$

7. Answer: $5\sqrt{5}$

- Simplify $\sqrt{45} = \sqrt{9 \times 5} = 3\sqrt{5}$
- Simplify $\sqrt{20} = \sqrt{4 \times 5} = 2\sqrt{5}$
- Add like radicals: $3\sqrt{5} + 2\sqrt{5} = 5\sqrt{5}$

8. Answer: $2\sqrt{3}$

- Multiply inside the radical: $\sqrt{6 \times 2} = \sqrt{12}$
- Factor $\sqrt{12} = \sqrt{4 \times 3} = \sqrt{4} \times \sqrt{3} = 2\sqrt{3}$

9. Answer: $3m\sqrt[3]{n^2}$

- Factor: $\sqrt[3]{27} = 3$ (perfect cube), $\sqrt[3]{m^3} = m$ (perfect cube)
- For $n\sqrt[3]{}$, write $n\sqrt[3]{} = n^3 \times n^2$, so $\sqrt[3]{n^3 \times n^2} = n\sqrt[3]{n^2}$
- Combine: $3 \times m \times n \times \sqrt[3]{n^2} = 3mn\sqrt[3]{n^2}$

10. Answer: $13\sqrt{2}$

Math is hard. So we made it human.

- Simplify $2\sqrt{50} = 2\sqrt{(25 \times 2)} = 2 \times 5\sqrt{2} = 10\sqrt{2}$
 - Simplify $\sqrt{8} = \sqrt{(4 \times 2)} = 2\sqrt{2}$
 - Combine: $21\sqrt{2} - 10\sqrt{2} + 2\sqrt{2} = 13\sqrt{2}$
-
