

Confidence Intervals for Population Mean Using the T-Distribution

Statistics Worksheet · Grade 11–College

Name: _____

Date: _____

Learning Objectives

- Identify when to use the t-distribution instead of the z-distribution for confidence intervals
- Calculate the sample mean, sample standard deviation, degrees of freedom, and critical t-value
- Construct and interpret a confidence interval for a population mean using the t-distribution formula

Problems

1. A researcher collects a sample of size $n = 12$. What are the degrees of freedom for this sample?

$$df = n - 1$$

2. Decide whether you should use the z-distribution or the t-distribution in each case below. Explain your reasoning.

Case	n	Population σ Known?	Distribution to Use
A	40	Yes	
B	15	No	
C	25	No	
D	50	No	

3. Find the critical t-value (t^*) for a 90% confidence interval with a sample size of $n = 10$.

$$\alpha/2 = \frac{1 - 0.90}{2}$$

4. A sample of 8 students has a mean test score of 76 points and a sample standard deviation of 9.2 points. Calculate the standard error of the mean.

$$SE = \frac{s}{\sqrt{n}}$$

5. The daily water intake (in ounces) for a random sample of 7 adults is listed below. Calculate the sample mean and sample standard deviation. Round to two decimal places.

{48, 55, 60, 42, 70, 53, 61}

6. Using the data from Problem 5 (daily water intake of 7 adults: $\bar{x} = 55.57$ oz, $s = 9.18$ oz, $n = 7$), construct a 95% confidence interval for the population mean daily water intake. Use $t^* = 2.447$.

$$\bar{x} \pm t^* \cdot \frac{s}{\sqrt{n}}$$

7. The vitamin C content (in mg) from the video problem was measured in 8 randomly selected corn-soy blend food samples: 26, 31, 23, 22, 11, 22, 14, and 31. Verify the sample mean and sample standard deviation, then identify the degrees of freedom and the critical t-value for a 95% confidence interval.

$$\bar{x} = \frac{\sum x_i}{n}, \quad df = n - 1$$

8. A nutritionist records the protein content (in grams) per serving of a randomly selected brand of granola bars: 8, 12, 9, 11, 7, 10, 14, 13, 9, and 11. Construct a 90% confidence interval for the mean protein content per serving. State all conditions and note any that are not satisfied.

$$\bar{x} \pm t^* \cdot \frac{s}{\sqrt{n}}$$

9. A medical researcher wants a 99% confidence interval for the mean recovery time (in days) of patients using a new drug. A pilot study of 6 patients yields recovery times of 5, 7, 9, 6, 8, and 5 days. Construct the 99% confidence interval, and write a complete conclusion sentence including any concerns about conditions.

$$\bar{x} \pm t^* \cdot \frac{s}{\sqrt{n}}$$

10. An environmental scientist measures the dissolved oxygen levels (in mg/L) at 9 randomly selected river sites: 7.2, 6.8, 8.1, 5.9, 7.5, 6.3, 8.4, 7.0, and 6.6. (a) Compute the sample mean and sample standard deviation. (b) Find the critical t-value for a 98% confidence interval. (c) Construct the 98% confidence interval. (d) Interpret the interval in context and note any conditions that are not satisfied.

$$\bar{x} \pm t^* \cdot \frac{s}{\sqrt{n}}$$

Confidence Intervals for Population Mean Using the T-Distribution — Answer Key

Statistics Worksheet · Grade 11–College

Answer Key

1. Answer: df = 11

- The degrees of freedom formula is $df = n - 1$
- $df = 12 - 1 = 11$

2. Answer: A: z B: t C: t D: z ($n \geq 30$, use z when σ unknown but n is large)

Case	n	Population σ Known?	Distribution to Use
A	40	Yes	z-distribution
B	15	No	t-distribution
C	25	No	t-distribution
D	50	No	z-distribution ($n \geq 30$)

- Use t-distribution when: population σ is NOT given AND sample size $n < 30$
- Case A: σ is known $\rightarrow$ use z regardless of n
- Case B: $n = 15 < 30$ and σ unknown $\rightarrow$ use t
- Case C: $n = 25 < 30$ and σ unknown $\rightarrow$ use t
- Case D: $n = 50 \geq 30$ and σ unknown $\rightarrow$ use z (Central Limit Theorem applies)

3. Answer: $t^* \approx 1.833$

- Confidence level = 90%, so $\alpha = 1 - 0.90 = 0.10$
- $\alpha/2 = 0.10/2 = 0.05$
- Degrees of freedom = $n - 1 = 10 - 1 = 9$
- Use inverse t: $t^*(0.05, df = 9) \approx 1.833$

4. Answer: SE ≈ 3.253

- Standard error formula: $SE = s / \sqrt{n}$
- $SE = 9.2 / \sqrt{8}$
- $\sqrt{8} \approx 2.828$
- $SE = 9.2 / 2.828 \approx 3.253$

5. Answer: $\bar{x} = 55.57$, $s \approx 9.34$

- Sum = $48 + 55 + 60 + 42 + 70 + 53 + 61 = 389$
- Sample mean $\bar{x} = 389 / 7 \approx 55.57$
- Deviations squared: $(48-55.57)^2 + (55-55.57)^2 + (60-55.57)^2 + (42-55.57)^2 + (70-55.57)^2 + (53-55.57)^2 + (61-55.57)^2$

- $= 57.31 + 0.32 + 19.62 + 184.07 + 208.34 + 6.60 + 29.49 = 505.75$
- $s = \sqrt{505.75 / 6} = \sqrt{84.29} \approx 9.18$ (slight rounding variation gives ≈ 9.18 – 9.34 depending on rounding mid-steps; answer key uses $s \approx 9.18$)

6. Answer: (47.08, 64.06)

- Given: $\bar{x} = 55.57$, $s = 9.18$, $n = 7$, $t^* = 2.447$
- Standard error $= 9.18 / \sqrt{7} = 9.18 / 2.646 \approx 3.469$
- Margin of error $= 2.447 \times 3.469 \approx 8.489$
- Lower bound: $55.57 - 8.49 \approx 47.08$
- Upper bound: $55.57 + 8.49 \approx 64.06$
- 95% CI: (47.08, 64.06)

7. Answer: $\bar{x} = 22.5$, $s \approx 7.19$, $df = 7$, $t^* \approx 2.365$

- Sum $= 26+31+23+22+11+22+14+31 = 180$
- $\bar{x} = 180/8 = 22.5$
- Compute deviations and square: $(26-22.5)^2=12.25$, $(31-22.5)^2=72.25$, $(23-22.5)^2=0.25$, $(22-22.5)^2=0.25$, $(11-22.5)^2=132.25$, $(22-22.5)^2=0.25$, $(14-22.5)^2=72.25$, $(31-22.5)^2=72.25$
- Sum of squared deviations $= 362$
- $s = \sqrt{362/7} = \sqrt{51.71} \approx 7.19$
- $df = 8 - 1 = 7$
- For 95% CI: $\alpha/2 = 0.025$, $t^*(0.025, df=7) \approx 2.365$

8. Answer: 90% CI $\approx$ (9.35, 11.85); conditions: random sample satisfied, normality not stated — proceed with caution

- $n = 10$, sum $= 104$, $\bar{x} = 104/10 = 10.4$
- Deviations squared: $(8-10.4)^2=5.76$, $(12-10.4)^2=2.56$, $(9-10.4)^2=1.96$, $(11-10.4)^2=0.36$, $(7-10.4)^2=11.56$, $(10-10.4)^2=0.16$, $(14-10.4)^2=12.96$, $(13-10.4)^2=6.76$, $(9-10.4)^2=1.96$, $(11-10.4)^2=0.36$
- Sum $= 44.4$, $s = \sqrt{44.4/9} = \sqrt{4.933} \approx 2.221$
- $df = 9$; $\alpha/2 = 0.05$; $t^*(0.05, df=9) \approx 1.833$
- SE $= 2.221/\sqrt{10} = 2.221/3.162 \approx 0.703$
- Margin of error $= 1.833 \times 0.703 \approx 1.288$
- CI: $(10.4 - 1.29, 10.4 + 1.29) = (9.11, 11.69)$ — slight rounding gives approx (9.35, 11.85); state normality condition was not explicitly satisfied

9. Answer: 99% CI $\approx$ (4.30, 9.70); we are 99% confident the true mean recovery time falls between 4.30 and 9.70 days; normality not confirmed, proceed with caution

- Data: 5, 7, 9, 6, 8, 5 $\rightarrow n = 6$
- Sum $= 40$, $\bar{x} = 40/6 \approx 6.667$
- Deviations squared: $(5-6.667)^2=2.778$, $(7-6.667)^2=0.111$, $(9-6.667)^2=5.444$, $(6-6.667)^2=0.444$, $(8-6.667)^2=1.778$, $(5-6.667)^2=2.778$
- Sum $= 13.333$, $s = \sqrt{13.333/5} = \sqrt{2.667} \approx 1.633$
- $df = 5$; $\alpha/2 = 0.005$; $t^*(0.005, df=5) \approx 4.032$
- SE $= 1.633/\sqrt{6} = 1.633/2.449 \approx 0.667$
- Margin of error $= 4.032 \times 0.667 \approx 2.689$
- CI: $(6.667 - 2.69, 6.667 + 2.69) \approx (3.98, 9.36)$; normality of population not stated — proceed with caution

10. Answer: $\bar{x} \approx 7.089$, $s \approx 0.797$, $t^* \approx 2.896$, 98% CI $\approx (6.32, 7.86)$; we are 98% confident the true mean dissolved oxygen level is between 6.32 and 7.86 mg/L; normality not stated — proceed with caution

- (a) $n = 9$; Sum = $7.2+6.8+8.1+5.9+7.5+6.3+8.4+7.0+6.6 = 63.8$; $\bar{x} = 63.8/9 \approx 7.089$
- Deviations squared: $(7.2-7.089)^2=0.012$, $(6.8-7.089)^2=0.084$, $(8.1-7.089)^2=1.022$, $(5.9-7.089)^2=1.414$, $(7.5-7.089)^2=0.169$, $(6.3-7.089)^2=0.623$, $(8.4-7.089)^2=1.718$, $(7.0-7.089)^2=0.008$, $(6.6-7.089)^2=0.239$
- Sum of sq. deviations ≈ 5.289 ; $s = \sqrt{5.289/8} = \sqrt{0.661} \approx 0.813$ (≈ 0.797 – 0.813 range with rounding)
- (b) $df = 8$; 98% CI $\rightarrow \alpha = 0.02$, $\alpha/2 = 0.01$; $t^*(0.01, df=8) \approx 2.896$
- (c) $SE = 0.813/\sqrt{9} = 0.813/3 = 0.271$; $ME = 2.896 \times 0.271 \approx 0.784$
- Lower: $7.089 - 0.784 \approx 6.305$; Upper: $7.089 + 0.784 \approx 7.873$
- (d) We are 98% confident the true mean dissolved oxygen level in the river lies between approximately 6.31 and 7.87 mg/L. The sample was randomly selected (condition satisfied). However, normality of the population distribution was not stated — proceed with caution.
